CONTENTS

FOREWORD.....	4
INTRODUCTION.....	5
1 Scope.....	6
2 Normative references	6
3 Terms and definitions	6
4 Symbols and abbreviated terms.....	7
5 Introduction to the socialized IoT systems	7
5.1 Three technological waves in ICT	7
5.2 Resemblances between comprehensive IoT systems and human social dynamics	8
6 Key features of socialized IoT systems.....	8
7 Socialized attributes of IoT system	10
7.1 General.....	10
7.2 Socialized network.....	10
7.2.1 General	10
7.2.2 Topology-driven network.....	10
7.2.3 Target-driven network.....	12
7.2.4 Task-driven network	13
7.2.5 Environment-driven network	14
7.3 Socialized collaboration	15
7.3.1 General	15
7.3.2 Socialized collaborative division of labour.....	15
7.3.3 Socialized collaborative processing	16
7.3.4 Socialized self-learning.....	17
7.4 Socialized service.....	18
7.4.1 General	18
7.4.2 Socialized service coordination.....	19
7.4.3 Socialized service release	20
7.4.4 Socialized service update	21
8 Security in the socialized IoT system	21
8.1 Sensing security in IoT system.....	21
8.2 Socialized sensing security mechanism	22
9 Application of the socialized IoT system	23
9.1 General.....	23
9.2 Key features of intrusion prevention system.....	24
9.3 System design based on the concept of the socialized IoT system.....	24
9.3.1 General	24
9.3.2 Socialized network.....	25
9.3.3 Socialized collaboration	26
9.3.4 Socialized service.....	27
9.4 Inspiration of IoT development mode	27
Bibliography.....	29
Figure 1 – IoT promotes the third wave in information technology	8
Figure 2 – Hierarchy of topology-driven network	11

Figure 3 – Example of target-driven network 12

Figure 4 – Node selectivity of task-driven network 13

Figure 5 – Socialized collaboration of IoT system 15

Figure 6 – Socialized self-learning similar to mobile agent 18

Figure 7 – Socialized service release..... 20

Figure 8 – Socialized service update..... 21

Figure 9 – The conceptual hierarchy of the IoT security 22

Figure 10 – Realization mechanism of IoT sensing security based on socialized collaborative processing 23

Figure 11 – Network infrastructure of the intrusion prevention system..... 25

Figure 12 – Socialized collaborative division of labour based on SNR..... 26

Figure 13 – Target detection based on self-learning..... 27

Figure 14 – IoT development mode based on "Common platform + Application profiles" 28

INTERNET OF THINGS (IoT) – SOCIALIZED IoT SYSTEM RESEMBLING HUMAN SOCIAL INTERACTION DYNAMICS

FOREWORD

- 1) ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.
- 2) The formal decisions or agreements of IEC and ISO on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC and ISO National bodies.
- 3) IEC and ISO documents have the form of recommendations for international use and are accepted by IEC and ISO National bodies in that sense. While all reasonable efforts are made to ensure that the technical content of IEC and ISO documents is accurate, IEC and ISO cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC and ISO National bodies undertake to apply IEC and ISO documents transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC and ISO document and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC and ISO do not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC and ISO marks of conformity. IEC and ISO are not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this document.
- 7) No liability shall attach to IEC and ISO or their directors, employees, servants or agents including individual experts and members of its technical committees and IEC and ISO National bodies for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this ISO/IEC document or any other IEC and ISO documents.
- 8) Attention is drawn to the Normative references cited in this document. Use of the referenced publications is indispensable for the correct application of this document.
- 9) Attention is drawn to the possibility that some of the elements of this ISO/IEC document may be the subject of patent rights. IEC and ISO shall not be held responsible for identifying any or all such patent rights.

IEC TR 30174 has been prepared by subcommittee 41: Internet of Things and Digital Twin, of ISO/IEC joint technical committee 1: Information technology. It is a Technical Report.

The text of this Technical Report is based on the following documents:

Draft	Report on voting
JTC1-SC41/227/DTR	JTC1-SC41/240A/RVDTR

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this Technical Report is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs and www.iso.org/directives.

IMPORTANT – The "colour inside" logo on the cover page of this document indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

The Internet of Things (IoT) technology is the third wave of information industry, following the computer, communications network and the Internet. It provides the technology tools to build an effective interactive IoT system connecting human users and the physical world, which causes the changes in individual's daily life and also in the operations of human society. The innovative ideas can be implemented in IoT systems creating new markets for technology-based but user-friendly services. The technologies in the IoT systems will keep evolving with improving the existing technology and also the insertion of new technologies.

The communications network focuses on connection and transmission, and it realizes transmission service. The Internet focuses on information sharing, and provides services related to information sharing. The IoT systems focus on the objective physical world, realizing the basic sensing service and other services for the objects of interest (i.e. targets), events, etc., in the physical world.

In order to realize the sensing of the complex physical world, an IoT system needs to have an organized and coordinated sensing capability. For a specific target, this capability activates relevant sensor nodes, and division of labour and cooperation strategies are applied, which is similar to an enterprise that organizes people with required capabilities to form a project team and completes the project with proper division of labour and cooperation. In this perspective, therefore, it can be stated that the IoT system has socialized attributes as IoT nodes and terminals establish an orderly socialized system.

This document comprises five main clauses. Clause 5 introduces the background and motivations for the study of the socialized IoT system. Clause 6 discusses the essential differences of the IoT systems compared to the communications network and the Internet. This comparison is summarized with the key features of the socialized IoT system. Clause 7 further analyses the socialized network, socialized collaboration and socialized service, which are designated as the three pillars of the IoT socialized attributes. Clause 8 addresses the sensing security issue for IoT systems. Clause 9 discusses the application methods of the socialized IoT attributes using a use case analysis, such as the intrusion prevention system or infrastructure protection. This document provides readers with the knowledge of the socialized characteristics and features of the IoT system, and inspires readers to adopt them in the design of IoT systems and provision of IoT services.

INTERNET OF THINGS (IoT) – SOCIALIZED IoT SYSTEM RESEMBLING HUMAN SOCIAL INTERACTION DYNAMICS

1 Scope

This document describes:

- key features of the socialized IoT systems, e.g. sensing the external physical world, resolving the uncertainties of targets, satisfying users' demand and providing quality service, etc.;
- socialized attributes, i.e. socialized network, socialized collaboration, and socialized services, which are derived from the key features; and
- guidelines on how to use or apply the socialized attributes in the design and development of IoT systems.
